

## NCERT Solutions for Class 10 Maths Unit 9

### Some Applications of Trigonometry Class 10

#### Unit 9 Some Applications of Trigonometry Exercise 9.1 Solutions

##### Exercise 9.1 : Solutions of Questions on Page Number : 203

Q1 :

A circus artist is climbing a 20 m long rope, which is tightly stretched and tied from the top of a vertical pole to the ground. Find the height of the pole, if the angle made by the rope with the ground level is  $30^\circ$ .

Answer :

It can be observed from the figure that AB is the pole.

In  $\triangle ABC$ ,

$$\frac{AB}{AC} = \sin 30^\circ$$
$$\frac{AB}{20} = \frac{1}{2}$$
$$AB = \frac{20}{2} = 10$$

Therefore, the height of the pole is 10 m.

Q2 :

A tree breaks due to storm and the broken part bends so that the top of the tree touches the ground making an angle  $30^\circ$  with it. The distance between the foot of the tree to the point where the top touches the ground is 8 m. Find the height of the tree.

Answer :

Let AC was the original tree. Due to storm, it was broken into two parts. The broken part  $A'B$  is making  $30^\circ$  with the ground.

In  $\Delta A'BC$ ,

$$\frac{BC}{A'C} = \tan 30^\circ$$

$$\frac{BC}{8} = \frac{1}{\sqrt{3}}$$

$$BC = \left(\frac{8}{\sqrt{3}}\right) \text{m}$$

$$\frac{A'C}{A'B} = \cos 30^\circ$$

$$\frac{8}{A'B} = \frac{\sqrt{3}}{2}$$

$$A'B = \left(\frac{16}{\sqrt{3}}\right) \text{m}$$

Height of tree =  $A'B + BC$

$$= \left(\frac{16}{\sqrt{3}} + \frac{8}{\sqrt{3}}\right) \text{m} = \frac{24}{\sqrt{3}} \text{m}$$

$$= 8\sqrt{3} \text{m}$$

Hence, the height of the tree is  $8\sqrt{3} \text{m}$ .

**Q3 :**

A contractor plans to install two slides for the children to play in a park. For the children below the age of 5 years, she prefers to have a slide whose top is at a height of 1.5 m, and is inclined at an angle of  $30^\circ$  to the ground, whereas for the elder children she wants to have a steep side at a height of 3 m, and inclined at an angle of  $60^\circ$  to the ground. What should be the length of the slide in each case?

**Answer :**

It can be observed that AC and PR are the slides for younger and elder children respectively.

In  $\triangle ABC$ ,

$$\frac{AB}{AC} = \sin 30^\circ$$

$$\frac{1.5}{AC} = \frac{1}{2}$$

$$AC = 3 \text{ m}$$

In  $\triangle PQR$ ,

$$\frac{PQ}{PR} = \sin 60^\circ$$

$$\frac{3}{PR} = \frac{\sqrt{3}}{2}$$

$$PR = \frac{6}{\sqrt{3}} = 2\sqrt{3} \text{ m}$$

Therefore, the lengths of these slides are 3 m and  $2\sqrt{3}$  m.

**Q4 :**

The angle of elevation of the top of a tower from a point on the ground, which is 30 m away from the foot of the tower is  $30^\circ$ . Find the height of the tower.

Answer :

Let AB be the tower and the angle of elevation from point C (on ground) is  $30^\circ$ .

In  $\triangle ABC$ ,

$$\frac{AB}{BC} = \tan 30^\circ$$
$$\frac{AB}{30} = \frac{1}{\sqrt{3}}$$
$$AB = \frac{30}{\sqrt{3}} = 10\sqrt{3} \text{ m}$$

Therefore, the height of the tower is  $10\sqrt{3} \text{ m}$ .

Q5 :

A kite is flying at a height of 60 m above the ground. The string attached to the kite is temporarily tied to a point on the ground. The inclination of the string with the ground is  $60^\circ$ . Find the length of the string, assuming that there is no slack in the string.

Answer :

Let K be the kite and the string is tied to point P on the ground.

In  $\triangle KLP$ ,

$$\frac{KL}{KP} = \sin 60^\circ$$
$$\frac{60}{KP} = \frac{\sqrt{3}}{2}$$
$$KP = \frac{120}{\sqrt{3}} = 40\sqrt{3} \text{ m}$$

Hence, the length of the string is  $40\sqrt{3} \text{ m}$ .

**Q6 :**

A 1.5 m tall boy is standing at some distance from a 30 m tall building. The angle of elevation from his eyes to the top of the building increases from  $30^\circ$  to  $60^\circ$  as he walks towards the building. Find the distance he walked towards the building.

**Answer :**

Let the boy was standing at point S initially. He walked towards the building and reached at point T.

It can be observed that

$$PR = PQ - RQ$$

$$= (30 - 1.5) \text{ m} = 28.5 \text{ m} = \frac{57}{2} \text{ m}$$

In  $\triangle PAR$ ,

$$\frac{PR}{AR} = \tan 30^\circ$$
$$\frac{57}{2AR} = \frac{1}{\sqrt{3}}$$
$$AR = \left(\frac{57}{2}\sqrt{3}\right) \text{ m}$$

In  $\triangle PRB$ ,

$$\frac{PR}{BR} = \tan 60^\circ$$

$$\frac{57}{2 BR} = \sqrt{3}$$

$$BR = \frac{57}{2\sqrt{3}} = \left(\frac{19\sqrt{3}}{2}\right) \text{ m}$$

$$ST = AB$$

$$= AR - BR = \left(\frac{57\sqrt{3}}{2} - \frac{19\sqrt{3}}{2}\right) \text{ m}$$

$$= \left(\frac{38\sqrt{3}}{2}\right) \text{ m} = 19\sqrt{3} \text{ m}$$

Hence, he walked  $19\sqrt{3} \text{ m}$  towards the building.

**Q7 :**

From a point on the ground, the angles of elevation of the bottom and the top of a transmission tower fixed at the top of a 20 m high building are  $45^\circ$  and  $60^\circ$  respectively. Find the height of the tower.

**Answer :**

Let BC be the building, AB be the transmission tower, and D be the point on the ground from where the elevation angles are to be measured.

In  $\triangle BCD$ ,

$$\frac{BC}{CD} = \tan 45^\circ$$

$$\frac{20}{CD} = 1$$

$$CD = 20 \text{ m}$$

In  $\triangle ACD$ ,

$$\frac{AC}{CD} = \tan 60^\circ$$
$$\frac{AB + BC}{CD} = \sqrt{3}$$
$$\frac{AB + 20}{20} = \sqrt{3}$$
$$AB = (20\sqrt{3} - 20)\text{m}$$
$$= 20(\sqrt{3} - 1)\text{m}$$

Therefore, the height of the transmission tower is  $20(\sqrt{3} - 1)$  m.

**Q8 :**

A statue, 1.6 m tall, stands on a top of pedestal, from a point on the ground, the angle of elevation of the top of statue is  $60^\circ$  and from the same point the angle of elevation of the top of the pedestal is  $45^\circ$ . Find the height of the pedestal.

**Answer :**

Let AB be the statue, BC be the pedestal, and D be the point on the ground from where the elevation angles are to be measured.

In  $\triangle BCD$ ,

$$\frac{BC}{CD} = \tan 45^\circ$$
$$\frac{BC}{CD} = 1$$
$$BC = CD$$

In  $\triangle ACD$ ,

$$\frac{AB + BC}{CD} = \tan 60^\circ$$

$$\frac{AB + BC}{BC} = \sqrt{3}$$

$$1.6 + BC = BC\sqrt{3}$$

$$BC(\sqrt{3} - 1) = 1.6$$

$$BC = \frac{(1.6)(\sqrt{3} + 1)}{(\sqrt{3} - 1)(\sqrt{3} + 1)}$$

$$= \frac{1.6(\sqrt{3} + 1)}{(\sqrt{3})^2 - (1)^2}$$

$$= \frac{1.6(\sqrt{3} + 1)}{2} = 0.8(\sqrt{3} + 1)$$

Therefore, the height of the pedestal is  $0.8(\sqrt{3} + 1)$  m.

**Q9 :**

The angle of elevation of the top of a building from the foot of the tower is

$30^\circ$  and the angle of elevation of the top of the tower from the foot of the building is  $60^\circ$ . If the tower is 50 m high, find the height of the building.

**Answer :**

Let AB be the building and CD be the tower.

In  $\triangle CDB$ ,

$$\frac{CD}{BD} = \tan 60^\circ$$

$$\frac{50}{BD} = \sqrt{3}$$

$$BD = \frac{50}{\sqrt{3}}$$

In  $\triangle ABD$ ,

$$\frac{AB}{BD} = \tan 30^\circ$$

$$AB = \frac{50}{\sqrt{3}} \times \frac{1}{\sqrt{3}} = \frac{50}{3} = 16\frac{2}{3}$$

Therefore, the height of the building is  $16\frac{2}{3}$  m.

**Q10 :**

Two poles of equal heights are standing opposite each other on either side of the road, which is 80 m wide. From a point between them on the road, the angles of elevation of the top of the poles are  $60^\circ$  and  $30^\circ$ , respectively. Find the height of poles and the distance of the point from the poles.

**Answer :**

Let AB and CD be the poles and O is the point from where the elevation angles are measured.

In  $\triangle ABO$ ,

$$\frac{AB}{BO} = \tan 60^\circ$$

$$\frac{AB}{BO} = \sqrt{3}$$

$$BO = \frac{AB}{\sqrt{3}}$$

In  $\triangle CDO$ ,

$$\frac{CD}{DO} = \tan 30^\circ$$

$$\frac{CD}{80 - BO} = \frac{1}{\sqrt{3}}$$

$$CD\sqrt{3} = 80 - BO$$

$$CD\sqrt{3} = 80 - \frac{AB}{\sqrt{3}}$$

$$CD\sqrt{3} + \frac{AB}{\sqrt{3}} = 80$$

Since the poles are of equal heights,

$$CD = AB$$

$$CD \left[ \sqrt{3} + \frac{1}{\sqrt{3}} \right] = 80$$

$$CD \left( \frac{3+1}{\sqrt{3}} \right) = 80$$

$$CD = 20\sqrt{3} \text{ m}$$

$$BO = \frac{AB}{\sqrt{3}} = \frac{CD}{\sqrt{3}} = \left( \frac{20\sqrt{3}}{\sqrt{3}} \right) \text{ m} = 20 \text{ m}$$

$$DO = BD - BO = (80 - 20) \text{ m} = 60 \text{ m}$$

Therefore, the height of poles is  $20\sqrt{3} \text{ m}$  and the point is 20 m and 60 m far from these poles.

**Q11 :**

A TV tower stands vertically on a bank of a canal. From a point on the other bank directly opposite the tower the angle of elevation of the top of the tower is  $60^\circ$ . From another point 20 m away from this point on the line joining this point to the foot of the tower, the angle of elevation of the top of the tower is  $30^\circ$ . Find the height of the tower and the width of the canal.

**Answer :**

In  $\triangle ABC$ ,

$$\frac{AB}{BC} = \tan 60^\circ$$

$$\frac{AB}{BC} = \sqrt{3}$$

$$BC = \frac{AB}{\sqrt{3}}$$

In  $\triangle ABD$ ,

$$\frac{AB}{BD} = \tan 30^\circ$$

$$\frac{AB}{BC + CD} = \frac{1}{\sqrt{3}}$$

$$\frac{AB}{\frac{AB}{\sqrt{3}} + 20} = \frac{1}{\sqrt{3}}$$

$$\frac{AB\sqrt{3}}{AB + 20\sqrt{3}} = \frac{1}{\sqrt{3}}$$

$$3AB = AB + 20\sqrt{3}$$

$$2AB = 20\sqrt{3}$$

$$AB = 10\sqrt{3} \text{ m}$$

$$BC = \frac{AB}{\sqrt{3}} = \left(\frac{10\sqrt{3}}{\sqrt{3}}\right) \text{ m} = 10 \text{ m}$$

Therefore, the height of the tower is  $10\sqrt{3}$  m and the width of the canal is 10 m.

Q12 :

From the top of a 7 m high building, the angle of elevation of the top of a cable tower is  $60^\circ$  and the angle of depression of its foot is  $45^\circ$ . Determine the height of the tower.

Answer :

Let AB be a building and CD be a cable tower.

In  $\triangle ABD$ ,

$$\frac{AB}{BD} = \tan 45^\circ$$

$$\frac{7}{BD} = 1$$

$$BD = 7 \text{ m}$$

In  $\triangle ACE$ ,

$$AE = BD = 7 \text{ m}$$

$$\frac{CE}{AE} = \tan 60^\circ$$

$$\frac{CE}{7} = \sqrt{3}$$

$$CE = 7\sqrt{3} \text{ m}$$

$$\begin{aligned} CD &= CE + ED = (7\sqrt{3} + 7) \text{ m} \\ &= 7(\sqrt{3} + 1) \text{ m} \end{aligned}$$

Therefore, the height of the cable tower is  $7(\sqrt{3} + 1) \text{ m}$ .

Q13 :

As observed from the top of a 75 m high lighthouse from the sea-level, the angles of depression of two ships are  $30^\circ$  and  $45^\circ$ . If one ship is exactly behind the other on the same side of the lighthouse, find the distance between the two ships.

Answer :

Let AB be the lighthouse and the two ships be at point C and D respectively.

In  $\triangle ABC$ ,

$$\frac{AB}{BC} = \tan 45^\circ$$
$$\frac{75}{BC} = 1$$
$$BC = 75 \text{ m}$$

In  $\triangle ABD$ ,

$$\frac{AB}{BD} = \tan 30^\circ$$
$$\frac{75}{BC + CD} = \frac{1}{\sqrt{3}}$$
$$\frac{75}{75 + CD} = \frac{1}{\sqrt{3}}$$
$$75\sqrt{3} = 75 + CD$$
$$75(\sqrt{3} - 1) \text{ m} = CD$$

Therefore, the distance between the two ships is  $75(\sqrt{3} - 1) \text{ m}$ .

Q14 :

Distance travelled by balloon = EG = CG - CE

$$= (87\sqrt{3} - 29\sqrt{3}) \text{ m}$$

$$= 58\sqrt{3} \text{ m}$$

Q15 :

A straight highway leads to the foot of a tower. A man standing at the top of the tower observes a car as an angle of depression of  $30^\circ$ , which is approaching the foot of the tower with a uniform speed. Six seconds later, the angle of depression of the car is found to be  $60^\circ$ . Find the time taken by the car to reach the foot of the tower from this point.

Answer :

Let AB be the tower.

Initial position of the car is C, which changes to D after six seconds.

In  $\triangle ADB$ ,

$$\frac{AB}{DB} = \tan 60^\circ$$

$$\frac{AB}{DB} = \sqrt{3}$$

$$DB = \frac{AB}{\sqrt{3}}$$

In  $\triangle ABC$ ,

$$\frac{AB}{BC} = \tan 30^\circ$$

$$\frac{AB}{BD + DC} = \frac{1}{\sqrt{3}}$$

$$AB\sqrt{3} = BD + DC$$

$$AB\sqrt{3} = \frac{AB}{\sqrt{3}} + DC$$

$$DC = AB\sqrt{3} - \frac{AB}{\sqrt{3}} = AB\left(\sqrt{3} - \frac{1}{\sqrt{3}}\right) \\ = \frac{2AB}{\sqrt{3}}$$

Time taken by the car to travel distance DC  $\left(\text{i.e., } \frac{2AB}{\sqrt{3}}\right) = 6$  seconds

Time taken by the car to travel distance DB  $\left(\text{i.e., } \frac{AB}{\sqrt{3}}\right) = \frac{6}{2AB} \times \frac{AB}{\sqrt{3}}$

$$= \frac{6}{2} = 3 \text{ seconds}$$

**Q16 :**

The angles of elevation of the top of a tower from two points at a distance of 4 m and 9 m. from the base of the tower and in the same straight line with it are complementary. Prove that the height of the tower is 6 m.

**Answer :**

Let AQ be the tower and R, S are the points 4m, 9m away from the base of the tower respectively.

The angles are complementary. Therefore, if one angle is  $\theta$ , the other will be  $90 - \theta$ .

In  $\Delta AQR$ ,

$$\frac{AQ}{QR} = \tan\theta$$

$$\frac{AQ}{4} = \tan\theta \quad \dots(i)$$

In  $\Delta AQS$ ,

$$\frac{AQ}{SQ} = \tan(90 - \theta)$$

$$\frac{AQ}{9} = \cot \theta \quad \dots(ii)$$

On multiplying equations (i) and (ii), we obtain

$$\left(\frac{AQ}{4}\right)\left(\frac{AQ}{9}\right) = (\tan \theta) \cdot (\cot \theta)$$

$$\frac{AQ^2}{36} = 1$$

$$AQ^2 = 36$$

$$AQ = \sqrt{36} = \pm 6$$

However, height cannot be negative.

Therefore, the height of the tower is 6 m.
